Aim: To build an ETL pipeline using AWS Glue that reads data from Amazon S3, transforms it, and stores the processed data back in S3.

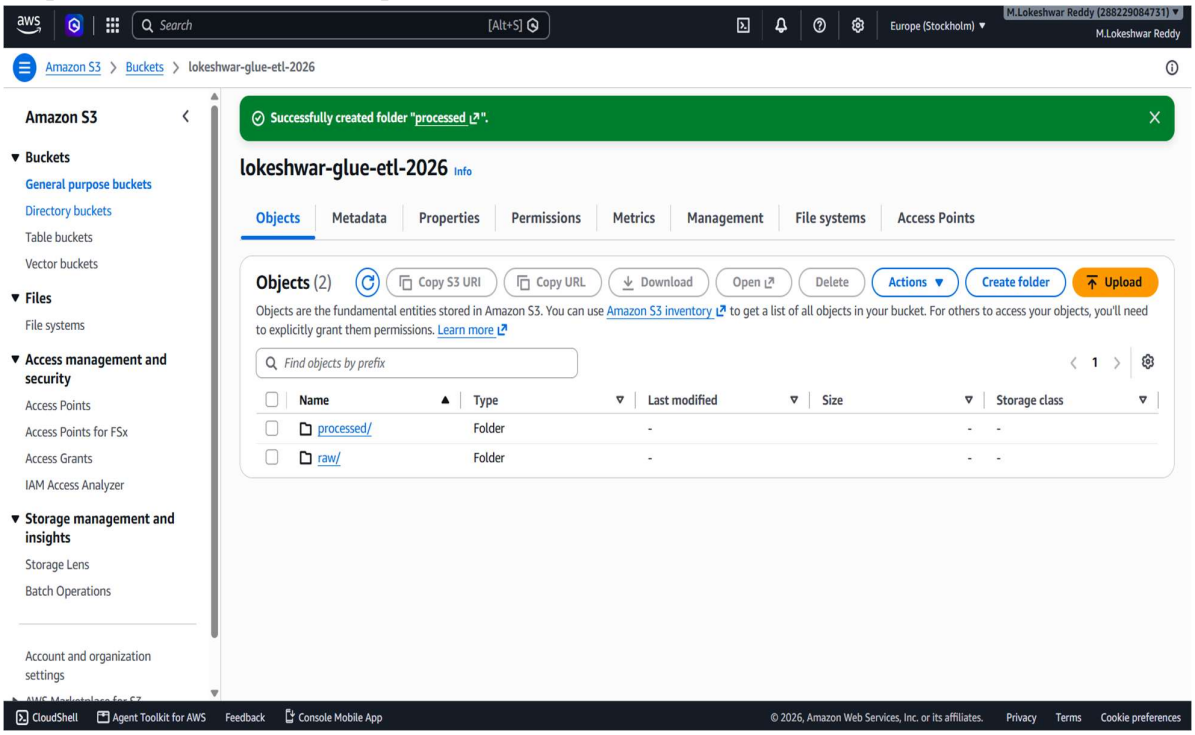

Step 1: Create an S3 bucket for the ETL pipeline

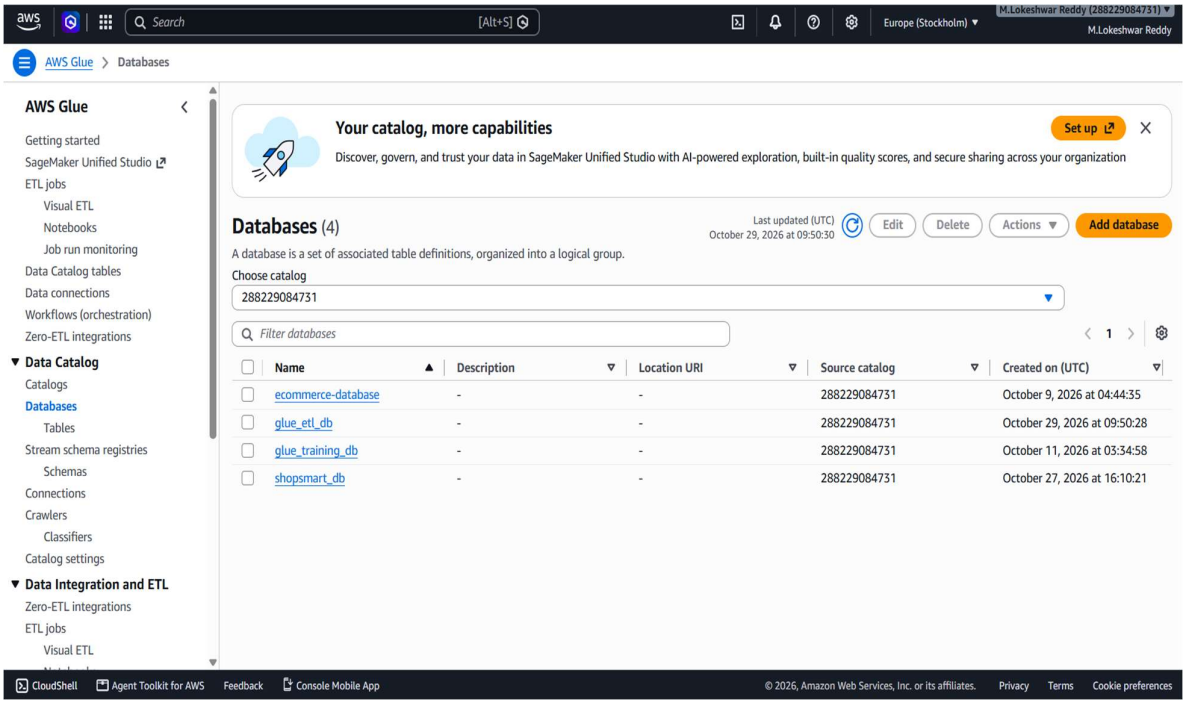

Step 2: Prepare the sample CSV data

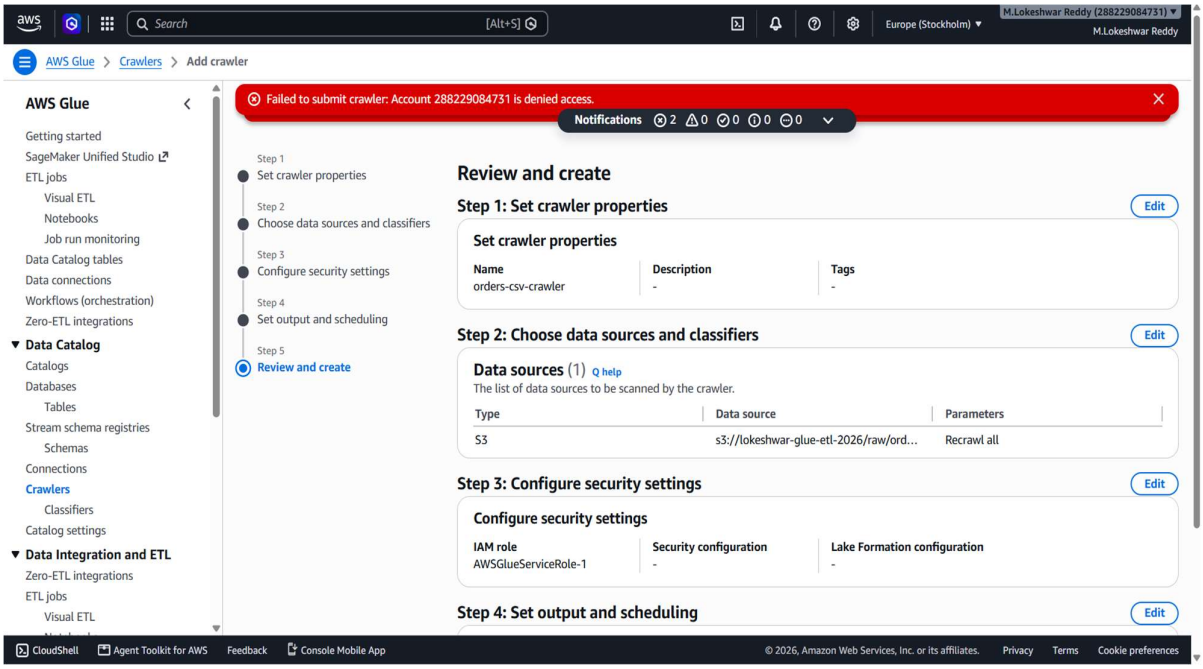

Step 3: Create folders and upload the CSV

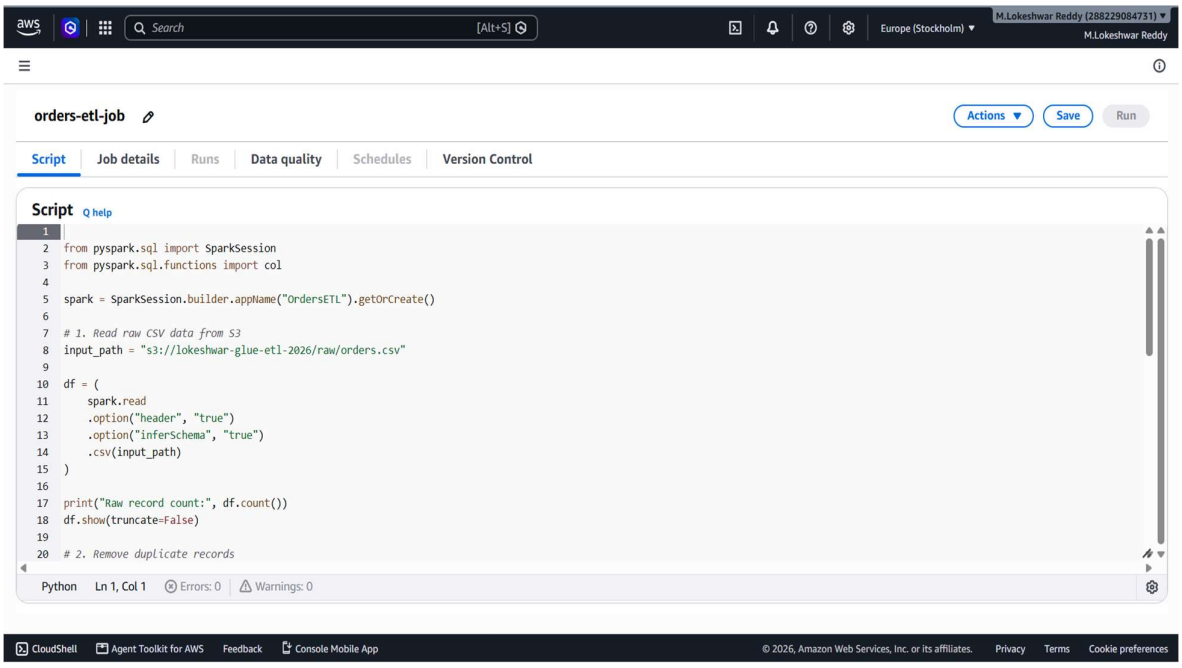

Step 4: Glue database created

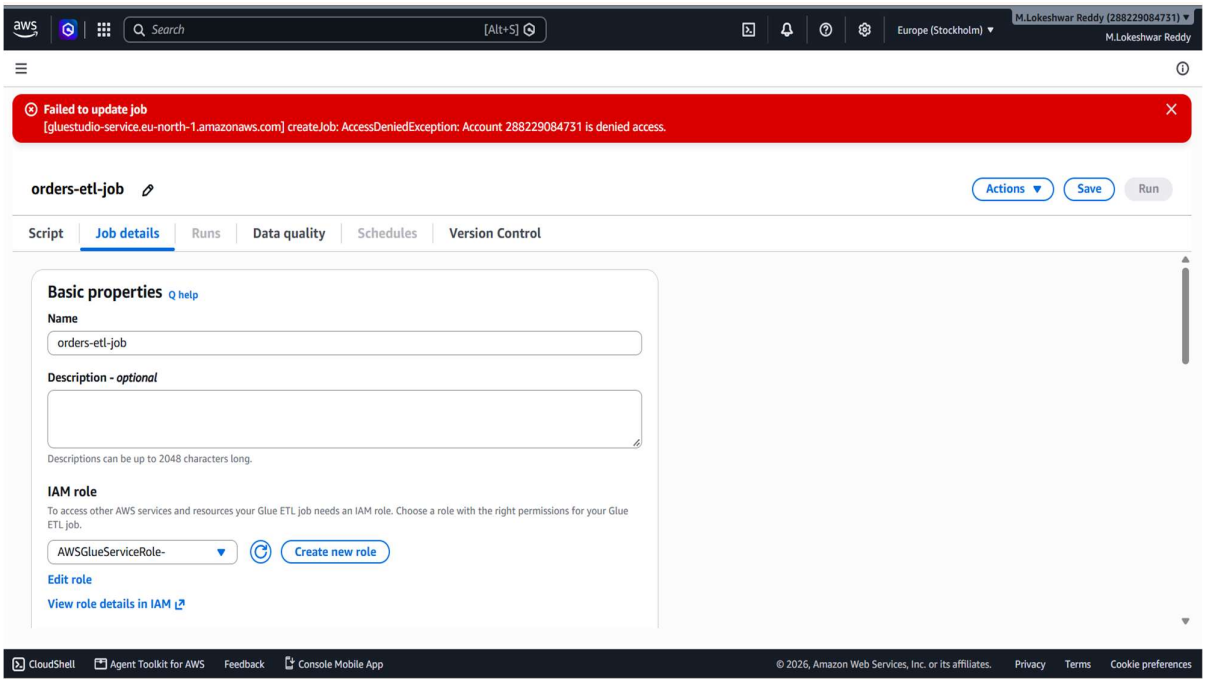

Step 5: Create an AWS Glue crawler

Step 6: Add the ETL script

Step 8: Configure job parameters

Result: Successfully created an AWS Glue ETL pipeline using Amazon S3 as the data source and destination. The pipeline read raw CSV data, removed duplicate and invalid records, calculated total order amounts, and saved the transformed data to the S3 processed/ folder.
